

How To: Use a Delta Ground Anchor

A guide to using the world's best pegs

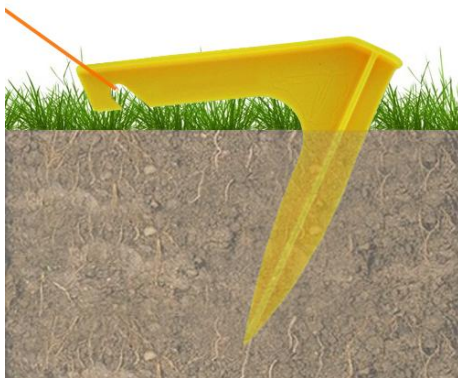

1) Attach the guy to the hook

Place the hook on the spike (in line with the guy) on the ground at the required distance and direction from the tent. Using the spike as a pivot, rotate the peg around point C until the top is almost horizontal. On insertion, the shape of the peg will ensure point A will end up very close to the required position

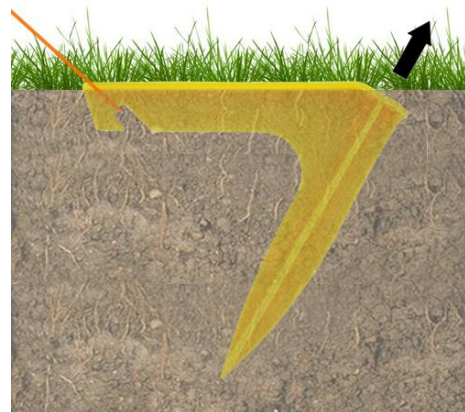

2) Start to insert the peg

Begin the insertion by striking point B with a mallet until point A touches the ground

3) Keep point A lower than point B

It is important to keep point A slightly lower than point B during insertion. This will ensure that the peg stays level. With the palm, push point A into the soil whilst continuing to strike point B until level. Adjust guy tension with runner.

4) Removal

Sometimes it is possible to remove Delta pegs by hand. If this is difficult, loosen the guy and pull back in the direction of points C and B.

Standard peg extractors can be used.
